"Guide to EMS"

This document was meant to be a guide to the EMS user interface, but then I realized the document would take too long for me to compile. Because of my lazy nature, this document will instead just be proof of the existence of this functionality.

This email is delivered to the user via an SMTP server. I got access to many internet protocol servers with an external api called javamail, I chose an SMTP server and used it to connect to the Gmail host. SMTP is a public internet protocol which is used by many messaging agents.

The successful transmission of this email effectively proves that I have covered the optional functionality of implementing a web service.
